5/1/25

New technology is now capable of communicating and making content in ways comparable to humans. It's called generative artificial intelligence (AI), and you can use it to excel in the workforce. Generative AI can save you time, no matter what field you work in. It can create content for marketing, forecast numbers for finance, or code for software developers. Publicists can use it to write press releases. Health professionals can even use it to improve their diagnosis. You, the worker, are still in charge, you just have more freedom to strategize, think big, and excel. Your team has been engaged by one of the largest think tanks to help propose policy suggestions to help minimize the potential negative impact on the jobs, industry and personal data.

Prompt

Problem 2

Biased and misinformative content generated with Generative AI (dominant political views, moral views, etc.)

“Generative propaganda: Evidence of AI’s impact from a state-backed disinformation campaign”

- AI-generated content was used in state sponsored campaigns to spread propaganda
- Graph above shows how AI-generated propaganda can easily be used to spread misleading content without people noticing a large difference

Problem 3

Heavy reliance on AI in order to complete jobs resulting in a lack of creativity and skill loss within the workforce due to reliance on generative AI.

Around the year of 2060 about 80% of people who rely on creativity for their career will be using generative AI within their work.

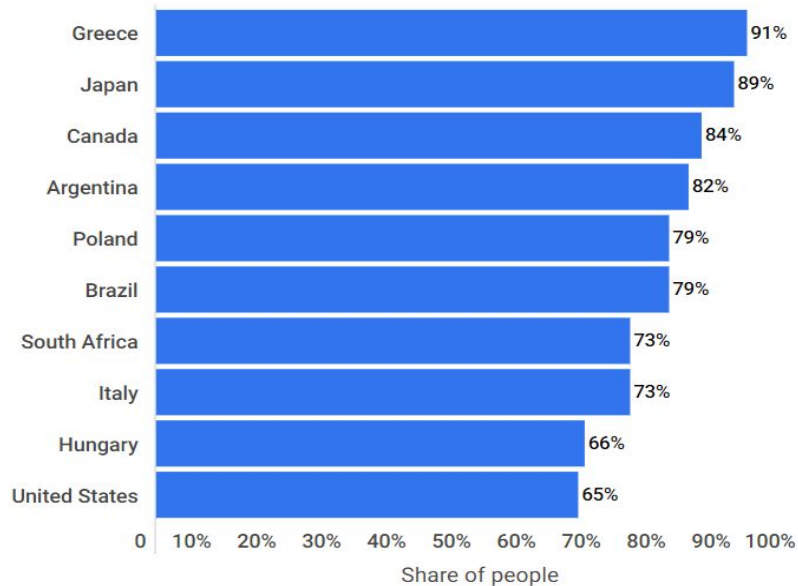

- Artists(music, fine art, graphic art, etc)
- Fashion designers
- Architectures

Minimizing human development in skills and innovation.

Problem 4

Massive job layoffs with generative AI making coders/artists/journalists/etc produce more content more efficiently and consistently.

SHARE OF PEOPLE WHO BELIEVE AI WILL DO MUCH OF THE WORK DONE BY HUMANS BY COUNTRY

Problem 5

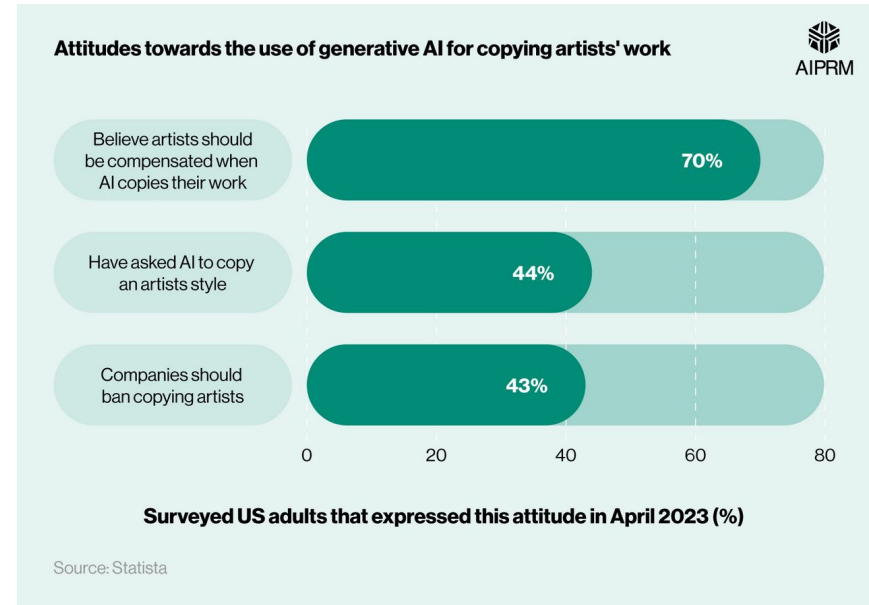

Extremely large skill gap between highly skilled/experienced workers who utilize AI in their work, and those trying to get into the industry.

43% workers believe that they are going to be replaced by other workers who are more knowledgeable on using AI skill sets.

- 40% of people who D2L surveyed felt that their employers don't find the importance of AI development with their current workers.
- 80% of IT specialist believe that they know how to use AI however, only 12% actually do and at least 70% need to better their AI skills.

Possible Solution 1

Enact strict AI copyright laws that make it very hard for AI-generated content to pass as an original work.

Possible Solution 2

Strict data laws on how personal data can be used within AI systems. Enforce that users get visually asked if their data can be used or not.

Possible Solution 3

Establish an AI Transparency and Disclosure Policy requiring organizations to clearly disclose when AI tools are used in content creation, customer interactions, or decision-making. Additionally, mandate that companies producing generative AI be classified based on data integrity (either as using unbiased or biased data) and require AI systems to inform users of which type of data their responses are based on.

Why AI transparency is important

83%

of CX leaders believe that **cybersecurity and data protection** are top priorities

65%

of CX leaders see **AI as a strategic necessity** as well as a reality

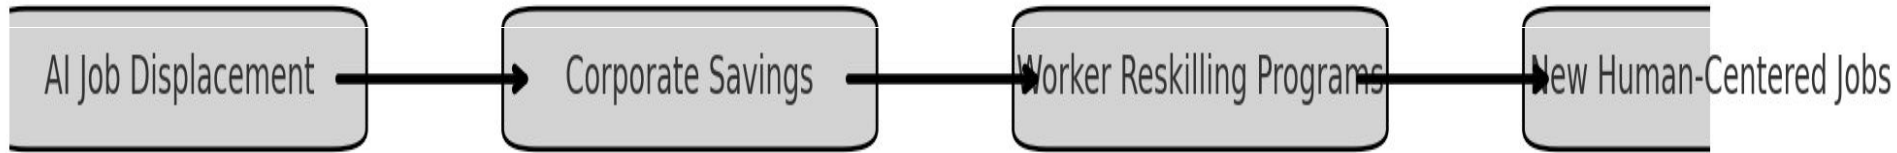

75%

of organizations believe that a **lack of transparency** could lead to customer churn

Possible Solution 4

Create an AI Productivity Dividend and Human-Centered Job Programs. There can be Requirements for companies benefiting from AI-driven layoffs to reinvest a portion of their savings into worker reskilling and profit-sharing programs. At the same time, governments and industries should launch certain divisions tailored to offering tax incentives to create new jobs where human creativity and connection remain essential.

Possible Solution 5

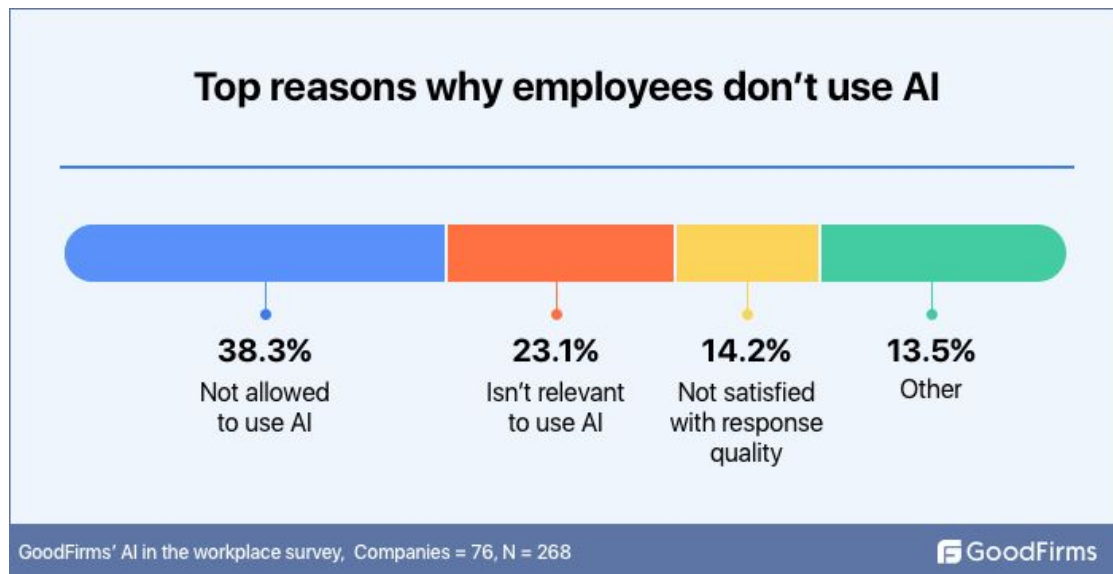

Establish an AI skills preservation Act that includes a tax on companies who sell AI-generated content. And use the funding from the tax to fund a government subsidized training program to train workers to blend traditional job skills with AI as a tool.

Possible Solution 6

Force companies to use AI at most as a tool instead of a product for existing artists if they so choose to use it.

Possible Solution 7

Protection for employees who choose not to use generative AI tools, as well as safeguards against their work being used to train AI systems that could ultimately replace their roles.

Questions?

THANK YOU
