

Prompt: New technology is now capable of communicating and making content in ways comparable to humans. It's called generative artificial intelligence (AI), and you can use it to excel in the workforce. Generative AI can save you time, no matter what field you work in. It can create content for marketing, forecast numbers for finance, or code for software developers. Publicists can use it to write press releases. Health professionals can even use it to improve their diagnosis. You, the worker, are still in charge, you just have more freedom to strategize, think big, and excel. Your team has been engaged by one of the largest think tanks to help propose policy suggestions to help minimize the potential negative impact on the jobs, industry and personal data.

Problems with Generative AI:

- ~~• Ethical concerns regarding personal data and how people's data is managed by AI~~
- ~~• Ethical concerns with using others' work with generative AI's products (code, art, essays, etc)~~
- ~~• Biased content generated with Generative AI (dominant political views, moral views, etc.)~~
- ~~• Copyright issues regarding generative AI using others' creations without their permission.~~
- ~~• Misguided information is being used, affecting workers' true understanding of certain topics and spreading misinformation~~
- ~~• Lack of workers using their skill set and knowledge to complete a task (relying on AI too much, and seen as unworthy of a job)~~
- ~~• Massive job layoffs with generative AI making coders/artists/journalists/etc produce more content more efficiently and consistently.~~
- ~~• Extremely large skill gap between highly skilled/experienced workers who utilize AI in their work, and those trying to get into the industry.~~
- ~~• Heavy reliance on AI in order to complete jobs. Skill loss within the workforce due to reliance on generative AI.~~
- ~~• Lack of creativity with products made with generative AI.~~

Potential Solutions:

- Job protection/security to prevent workers from losing their jobs
- Incentives/subsidies to promote learning how to use generative AI
- Generative AI regulations (the limits of what content can be generated)
- Monthly workshops on how to incorporate AI into doing tasks, along with the skills that they already know
- Strict copyright laws on AI-generated content
- Creating/using an unbiased generative AI system
- Complete double-check research before publishing work, instead of only relying on generative AI for research
- Require labeling for AI-generated content to enforce transparency.
- Mandate social media companies to detect and remove harmful or false AI-generated content.

- Fund public awareness programs to help identify false AI-generated content/verifying sources.
- Strict data laws on how personal data can be used within AI systems
- AI tax or usage fee.

Problems with Generative AI:	Potential Solutions:	Potential policies we could implement:
Ethical concerns with using others' work with generative AI's products (code, art, essays, etc)	Strict copyright laws on AI-generated content	Strict copyright laws on AI-generated content
Ethical concerns regarding personal data and how people's data is managed by AI	Strict data laws on how personal data can be used within AI systems	Strict data laws on how personal data can be used within AI systems. Enforce that users get visually asked if their data can be used or not.
Lack of workers using their skill set and knowledge to complete a task(relying on AI too much, and seen as unworthy of a job)	Monthly workshops on how to incorporate AI into doing tasks, along with the skills that they already know Generative AI regulations (the limits of what content can be generated)	Bi-monthly workshops on how to incorporate generative AI with tasks and teaching them how to blend in what limited information is provided with their skill set.
Misguided information is being used, affecting workers' true understanding of certain topics and spreading misinformation	Complete double-check research before publishing work, instead of only relying on generative AI for research Fund public awareness programs to help identify false AI-generated content/verifying sources. Mandate social media companies to detect and	After using generative AI, we advocate for our workers to double-check their research before publishing work, as well as fund and partner with programs that help identify false AI-generated content and sources.

	remove harmful or false AI-generated content. Creating/using an unbiased generative AI system	
Copyright issues regarding generative AI using others' creations without their permission.	Strict copyright laws on AI-generated content	Create a national registry where all AI content is logged and accountable, allowing for transparency.
Biased content generated with Generative AI (dominant political views, moral views, etc.)	Incentives/subsidies to promote learning how to use generative AI Generative AI regulations (the limits of what content can be generated) Creating/using an unbiased generative AI system Require labeling for AI-generated content to enforce transparency. Fund public awareness programs to help identify false AI-generated content/verify sources.	Generative AI data that gets entered should be categorized into 2 categories (unbiased and biased). And the AI should tell the user if the response is using unbiased or biased data.
Heavy reliance on AI in order to complete jobs. Skill loss within the workforce due to reliance on generative AI.	Job protection/security to prevent workers from losing their jobs Incentives/subsidies to promote learning how to use generative AI Monthly workshops on how to incorporate AI into doing tasks, along with the skills that they already know	Create an AI skill preservation act that provides government-subsidized training programs that blend traditional job skills with AI workflows. Additionally, create certification programs for responsible and skillful AI usage.

	Generative AI regulations (the limits of what content can be generated)	
Lack of creativity with products made with generative AI.	AI tax or usage fee	Force a tax on companies using AI-driven content, the amount can go to training programs for displaced workers.
Massive job layoffs with generative AI making coders/artists/journalists/etc produce more content more efficiently and consistently.	Job protection/security to prevent workers from losing their jobs. Strict copyright laws on AI-generated content Generative AI regulations (the limits of what content can be generated) AI tax or usage fee. Incentives/subsidies to promote learning how to use generative AI	Force companies to use AI at most as a tool instead of a product for existing artists if they so choose to use it. Also, enact strict AI copyright laws that make it very hard for AI-generated content to pass as an original work.
Extremely large skill gap between highly skilled/experienced workers who utilize AI in their work, and those trying to get into the industry.	Incentives/subsidies to promote learning how to use generative AI Monthly workshops on how to incorporate AI into doing tasks, along with the skills that they already know Creating/using an unbiased generative AI system Fund public awareness programs to help identify false AI-generated content/verifying sources.	Create an AI literacy program that subsidizes AI bootcamps, certifications and training for early career workers. Also subsidize licenses and tools required for students and entry level workers to practice using these AI tools.

	Require labeling for AI-generated content to enforce transparency.	
--	--	--

Potential policies we could implement:

- **Laws**

- AI usage disclosure law/policy:
 - Mandate organizations to disclose when AI tools are being used. This involves content creation, customer cases, and decision-making.
- Enact strict AI copyright laws that make it very hard for AI-generated content to pass as an original work.
- Strict data laws on how personal data can be used within AI systems. Enforce that users get visually asked if their data can be used or not.
- All companies that produce generative AI data that gets entered should be categorized into 2 categories (unbiased and biased). And the AI should tell the user if the response is using unbiased or biased data.
- Create an AI skill preservation act that provides government-subsidized training programs that blend traditional job skills with AI workflows. Additionally, create certification programs for responsible and skillful AI usage.
- Force a tax on companies using AI-driven content, the amount can go to training programs for displaced workers.
- Force companies to use AI at most as a tool instead of a product for existing artists if they so choose to use it.
- Protection for employees who refuse to use AI generative products.
- Protection for employees' work being used by a company to fuel generative AI to eventually replace the employee.

- **Company Policies**

- Bi-monthly workshops on how to incorporate generative AI with tasks and teaching them how to blend in what limited information is provided with their skill set.

Problems with Generative AI:

- Ethical concerns regarding personal data use and using others' work with generative AI's products (code, art, essays, etc) - **Matt**
- Biased and misinformation content generated with Generative AI (dominant political views, moral views, etc.) - **Eric**
- Heavy reliance on AI in order to complete jobs resulting in a lack of creativity and skill loss within the workforce due to reliance on generative AI.- **Zubaidah**
- Massive job layoffs with generative AI making coders/artists/journalists/etc produce more content more efficiently and consistently. - **Jared**
- Extremely large skill gap between highly skilled/experienced workers who utilize AI in their work, and those trying to get into the industry.
