

At the beginning of the project, our team took time to understand what the assignment was asking us to do. We started by coming up with a list of possible problems that could happen when using generative AI in the workplace. After that, we shared what we each found and worked together to improve our list. Next, we focused on finding solutions for those problems. We looked at which solutions worked best and made the most sense. We also split our solutions into two groups: ones that could be made into company rules or laws, and ones that are just good suggestions companies could follow to help their workers. To keep things simple for our presentation, we grouped together problems that were similar and matched them with solutions that worked for both. This helped us cut down on extra information and made it easier to build our PowerPoint slides. We each picked a part of the presentation to work on and found research to support our ideas. For my own research, I found it pretty easy to look into how generative AI can affect people in creative jobs. I found that using AI too much can hurt their creativity and slow down their personal growth. On the other hand, it was harder to find research about the gap between people who know how to use generative AI and those who don't—and how that gap can lead to some people losing their jobs. Even though it was a tough topic to find, I was still able to find research showing that many workers are worried about being replaced, feel like they aren't getting better at their jobs, and that their employers aren't helping them learn how to use AI tools in their work.
